## Description

AQD-D4U8GE32-SE is a DDR4 3200Mbps ECC U-DIMM high-speed, memory module that use 9pcs of 1024Mx 8 bits DDR4 SDRAM in FBGA package and a 4K bits serial EEPROM on a 288-pin printed circuit board.

AQD-D4U8GE32-SE is a Dual In-Line Memory Module and is intended for mounting into 288-pin edge connector sockets.

Synchronous design allows precise cycle control with the use of system clock. Data I/O transactions are possible on both edges of DQS. Range of operation frequencies, programmable latencies allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

Storage temperature	TSTG	-55~+100	°C	1,2

Note: 1. Stress greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.  
 2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.

DC Input Logic Low	V <sub>IL</sub> (DC)	1.2V	VSS	-	VREF-65	mV	

Note: (1) Under all conditions VDDQ must be less than or equal to VDD.  
 (2) VDDQ tracks with VDD. AC parameters are measured with VDD and VDDQ tied together.  
 (3) The DC bandwidth is limited to 20MHz.  
 (4) The AC peak noise on VREF may not allow VREF to deviate from VREF(DC) by more than ±1% VDD (for reference: approx. ±12mV)

NOTES :

1. Maximum limit not applicable.

2. tCCD\_L and tDLLK should be programmed according to the value defined per operating frequency.
  3. Data rate is greater than or equal to 1066 Mb/s.
  4. RFU.
  5. WRITE-to-READ when CRC and DM are both not enabled.
  6. WRITE-to-READ delay when CRC and DM are both enabled.
  7. The start of internal write transactions is defined as follows:
    - For BL8 (fixed by MRS and on-the-fly): rising clock edge four clock cycles after WL
    - For BC4 (on-the-fly): rising clock edge four clock cycles after WL
    - For BC4 (fixed by MRS): rising clock edge two clock cycles after WL
  8. For these parameters, the device supports  $t_{nPARAM} [nCK] = RU\{t_{PARAM} [ns]/t_{CK} (AVG) [ns]\}$ , in clock cycles, assuming all input clock jitter specifications are satisfied.
  9. Although unlimited row accesses to the same row is allowed within the refresh period, excessive row accesses to the same row over a long term can result in degraded operation.
  10. When operating in 1tCK WRITE preamble mode.
  11. When operating in 2tCK WRITE preamble mode.
  12. When CA parity mode is selected and the DLLoff mode is used, each REF command requires an additional "PL" added to tRFC refresh time.
  13. DRAM devices should be evenly addressed when being accessed. Disproportionate accesses to a particular row address may result in reduction of the product lifetime and/or reduction in data retention ability.
  14. Applicable from tCK (AVG) MIN to tCK (AVG) MAX as stated in the Speed Bin tables.
  15. JEDEC specifies a minimum of five clocks.
  16. The maximum read postamble is bound by tDQSCK (MIN) plus tQSH (MIN) on the left side and tHZ(DQS) MAX on the right side.
  17. The reference level of DQ output signal is specified with a midpoint as a widest part of output signal eye, which should be approximately  $0.7 \times V_{DDQ}$  as a center level of the static single-ended output peak-to-peak swing with a driver impedance of 34 ohms and an effective test load of 50 ohms to  $V_{TT} = V_{DDQ}$ .
  18. JEDEC hasn't agreed upon the definition of the deterministic jitter; the user should focus on meeting the total limit.
  19. Spread spectrum is not included in the jitter specification values. However, the input clock can accommodate spread-spectrum at a sweep rate in the range of 20–60 kHz with an additional 1% of tCK (AVG) as a long-term jitter component; however, the spread spectrum may not use a clock rate below tCK (AVG) MIN.
  20. The actual tCAL minimum is the larger of 3 clocks or 3.748ns/tCK; the table lists the applicable clocks required at targeted speed bin.
  21. The maximum READ preamble is bounded by tLZ(DQS) MIN on the left side and tDQSCK (MAX) on the right side. See figure in Clock to Data Strobe Relationship. Boundary of DQS Low-Z occur one cycle earlier in 2tCK toggle mode which is illustrated in READ Preamble.
  22. DQ falling signal middle-point of transferring from HIGH to LOW to first rising edge of DQS differential signal cross-point.
  23. The tPDA\_S/tPDA\_H parameters may use the tDS/tDH limits, respectively, if the signal is LOW the entire BL8
